Doctor’s office test – for diagnosis of *Helicobacter pylori*

**The golden standard**

*Helicobacter pylori* is extremely common in humans, infecting around 50% of the world’s population. It is recognized as the main etiological factor for chronic gastritis, peptic ulcer and also gastric cancer. Much suffering and even ulcer related deaths can be easily prevented through accurate diagnosis and appropriate treatment with antibiotics.

Urea Breath Test (UBT) is considered to be the gold standard for the diagnosis of *Helicobacter pylori*. It is non-invasive and it measures active infection.

**When diagnosis is just a breath away**

Heliprobe® System – a quick, reliable and painless test
**Accurate diagnosis within minutes**

*Heliprobe® System is a ¹⁴C-Urea Breath Test perfectly suited for primary diagnosis and for post treatment follow-up of Helicobacter pylori infection. It is a reliable, safe and cost-effective near-patient testing system consisting of three components – HeliCap™, BreathCard™ and Heliprobe® Analyzer.*

**Heliprobe® System**

A method with unique advantages

- **Convenience** – Easy to use, near patient testing, no need to send sample for analysis
- **Comfort** – Painless, no invasive gastroscopic tubing
- **Speed** – Samples are ready for analysis in only 10 minutes with test result available in 5 minutes
- **Reliability** – Sensitivity 95 %, specificity 100 %

The most reliable test is also the easiest to perform

*Heliprobe® is a test system which is easy to use for both patients and health care providers. No special training or experience is required. The test result is available on-site within 15–20 minutes after the patient has swallowed HeliCap™. This capsule contains 1 µCi ¹⁴C-labelled urea. The radioactive dose is very low – significantly lower than a normal x-ray dose.*

**The advantage of solid capsule formulation**

HeliCap™ solid capsule formulation minimizes false positive results in early breath samples by eliminating urea hydrolysis in the mouth and on the way to the stomach. In addition there is no need for a test preparation or a test-meal.

**How Heliprobe® System works in the patient**

A. On an empty stomach, the patient swallows a HeliCap™ capsule with a glass of water.

B. HeliCap™, containing ¹⁴C-labeled urea, disintegrates rapidly in the stomach and the ¹⁴C-urea is dissolved.

C. In the presence of *Helicobacter pylori*, the ¹⁴C-urea is metabolized into carbon dioxide and ammonia by the enzyme urease, produced by *Helicobacter pylori*.

D. The available ¹⁴C isotopes, now in the form of ¹⁴CO₂, diffuse into the blood to be transported to the lungs, where it is exhaled in the breath to be captured during sampling. A positive answer offers conclusive evidence that the patient is infected with *Helicobacter pylori*.

E. In the absence of *Helicobacter pylori*, the administered urea is absorbed from the gastrointestinal tract and subsequently voided.

**Heliprobe® System – Simply swallow, breathe and analyze**

1) Swallow HeliCap™
2) After a 10-minute wait, breathe into BreathCard™
3) Insert BreathCard™ into Heliprobe® Analyzer
4) Result is available in a few minutes
