HELIPROBE® SYSTEM
INSTRUCTIONS FOR USE
If the equipment is used in a manner not specified in these instructions, the protection provided by the equipment may be impaired.

These Instructions for Use are valid for Heliprobe® Analyzer and Heliprobe® BreathCard™.

Instructions for HeliCap™ are provided with the product.

To preserve the protection and functionality afforded by the equipment, please read these instructions prior to handling the equipment.

PLEASE NOTE
Translations of these Instructions for Use are available on the supplied USB-stick, at www.kibion.com/product-range/heliprobe or on request from Kibion at support.kibion@mayoly.com

2. Intended use and intended users

Heliprobe® System is intended for diagnosis of *Helicobacter pylori* infection in the gastrointestinal tract (stomach and duodenum) using the non-invasive $^{14}$C Urea Breath Test.

Heliprobe System is intended for professional use within medical healthcare facilities by trained medical staff, primarily in hospital or laboratory environments.

2.1. Heliprobe Analyzer

Heliprobe Analyzer is used to detect $^{14}$C in the Heliprobe BreathCard™ in conjunction with the $^{14}$C Urea Breath Test (UBT) of a patient. The analyzer is part of Heliprobe System.

2.2. Heliprobe BreathCard

Heliprobe BreathCard is intended for sampling and adsorption of $\text{CO}_2$ from the $^{14}$C Urea Breath Test (UBT) of a patient.

The patient exhales into Heliprobe BreathCard under supervision of medical staff.

3. Classification

Heliprobe Analyzer and Heliprobe BreathCard are classified as general In Vitro Diagnostic medical devices and CE-marked according to IVD Directive 98/79/EC.
4. Important user information

Heliprobe System is intended for professional use. The $^{14}$C Urea Breath Test shall be performed under supervision by healthcare professionals.

Heliprobe System includes following products intended for use together:

HeliCap™ – $^{14}$C-urea capsule
Heliprobe® BreathCard™ – for breath test sampling
Heliprobe® Analyzer – equipment for measuring and analyzing breath tests

Heliprobe System is validated for use with the included products. Other similar products shall not be used.

NOTE
User information and instructions for HeliCap are found in the leaflet provided with the HeliCap package. A user guide leaflet is provided with the Heliprobe BreathCard package.

5. Package contents – Heliprobe Analyzer

Heliprobe Analyzer
Protection Card
Power supply adapter
Heliprobe System Instructions for Use
USB-stick with translations of Instructions for Use

NOTE
Heliprobe BreathCard and HeliCap are not supplied with Heliprobe Analyzer. These products are ordered and supplied separately.
6. Safety and precautions

<table>

<tr>
<td>The analyzer is designed and tested to CISPR 11 Class A. In a domestic environment, it may cause radio interference. If so, take measures to mitigate the interference.</td>
</tr>
</tbody>
</table>
Heliprobe System $^{14}$C Urea Breath Test radioactivity is very low. $^{14}$C emits low energy β-radiation with a range of 24 cm in air and 0.25 mm in plastic.

1 capsule of HeliCap contains 37 kBq (1 μCi) $^{14}$C-urea, which gives a dose of 2.5 μSv.

Most of the $^{14}$C urea is excreted in the urine. Only a minor part is exhaled as $^{14}$CO$_2$.

Heliprobe BreathCard sampled from an infected patient typically contains 0.2–1.6 kBq (which corresponds to 200–2000 counts) and gives a maximal dose of 0.2 μSv.

The upper limit for occasional exposure is < 20 μSv/hour.
The upper limit for continuous exposure is < 2 μSv/hour.

**NOTE**
No protection or precautions are required for the safe handling of HeliCap, breath sampling or Heliprobe BreathCard.

The reactivity filter inside Heliprobe BreathCard contains lithium monohydroxide (LiOH), which may cause irritation in the respiratory tract and eyes on contact.

To avoid contact with LiOH:
- Do not disassemble Heliprobe BreathCard
- Never inhale through Heliprobe BreathCard. Remove Heliprobe BreathCard from the mouth if you must take a fresh breath.
- Exhale into Heliprobe BreathCard with an even pressure. Avoid blowing too hard.
- Ensure that the two air outlets on Heliprobe BreathCard are free so that exhaled air can pass freely through.
- Do not damage the plastic filter shield (mylar).

**NOTE**
In case of contact or suspected contact with LiOH, rinse the affected area immediately with water. Contact your local sales representative for further information and to report adverse effects.

Handle Heliprobe BreathCard with care.
The plastic filter shield (mylar) is very thin and sensitive to damage.
- Avoid touching the plastic filter shield (mylar) when handling Heliprobe BreathCard.
- Avoid scratching the plastic filter shield (mylar) when removing Heliprobe BreathCard from the package.

Do not use the Heliprobe BreathCard if the single package is damaged.

Individual breathcards cannot be identified. Do not mix up the breathcards.

Do not expose Heliprobe BreathCard to humidity or fluids.

Avoid getting saliva into Heliprobe BreathCard during exhalation.

Do not drink or eat between exhalations during the test.

Exhale into Heliprobe BreathCard until the indicator changes color from orange to yellow.

Heliprobe BreathCard is for single-use only.

Replace Heliprobe BreathCard in its package/envelope prior to disposal.

Dispose according to local rules or guidelines.

**NOTE**
Sampled Heliprobe BreathCard from an infected patient typically gives about 200–2000 counts. This is expected to contain between 0.2–1.6 kBq $^{14}$C (0.005–0.05 μCi).
7. Product description

7.1. Heliprobe Analyzer

Heliprobe Analyzer is a small desktop instrument easily operated from an upper front panel. Operational status and test results are shown on the display. A printer can be connected to the analyzer.

Heliprobe Analyzer contains two Geiger-Müller counters, an upper and a lower, mounted to create a slot for inserting Heliprobe BreathCard. An optical sensor detects proper insertion of Heliprobe BreathCard. The Protection Card must always be kept inserted in the slot between measurements.

</tbody>
</table>
7.2. Heliprobe BreathCard
Heliprobe BreathCard is a single-use consumable for $^{14}$C Urea Breath Test sampling. It has a mouthpiece for exhaling, two reactivity filters (upper and lower) for adsorbing CO$_2$ and an indicator to show completion of sampling. Two air outlets allow for the exhaled air to pass through. Every Heliprobe BreathCard is single-packed in an envelope to protect it from damage and humidity.

NOTE
To avoid exposure to humidity, keep Heliprobe BreathCard in its envelope package until use.

8. Principle of operation
*Helicobacter pylori* produces urease, an enzyme that catalyzes the hydrolysis of $^{14}$C-urea to $^{14}$CO$_2$ and NH$_3$. $^{14}$CO$_2$ is excreted in exhaled air while NH$_3$ and excess $^{14}$C-urea are excreted in urine. Under healthy conditions (absence of *Helicobacter pylori*), $^{14}$C-urea is not hydrolyzed and no $^{14}$CO$_2$ will be present in exhaled air. Hence, $^{14}$CO$_2$ is only present in exhaled air during *Helicobacter pylori* infection.

8.1. Urea Breath Test (UBT) sampling
The patient swallows a HeliCap capsule containing $^{14}$C urea (1 μCi) and wait 10 minutes before exhaling into Heliprobe BreathCard where the reactivity filters adsorb the CO$_2$. The indicator changes color from
orange to yellow to indicate when the reactivity filters are saturated and sampling completed.

8.2. Analysis

The analysis principle is based on measuring β-radiation from \(^{14}\)CO\(_2\) sampled in Heliprobe BreathCard. Radiation is measured (as counts) and the result is presented as Heliprobe 0=not infected, Heliprobe 1=borderline and Heliprobe 2=infected.

When the analyzer is turned on, background radiation is continuously measured by both the upper and lower Geiger-Müller counters during 40 cycles of 50 seconds each. To ensure correct background value, the analyzer should always be kept on with a Protection Card inserted between the measurements.

An optical sensor detects when Heliprobe BreathCard is inserted into Heliprobe Analyzer, and the measurement can only start if it is properly inserted. Pressing the start key starts a measurement cycle of 250 seconds. The two Geiger-Müller counters detect \(^{14}\)C radiation from the upper and the lower reactivity filters. Due to the short range of β-radiation, radiation from the upper filter can only be detected by the upper Geiger-Müller counter and radiation from the lower filter only by lower counter. The average background values from the upper and lower counters (BGR 1 and BGR 2) are subtracted from the upper and lower sample measurement values (d1 and d2). The adjusted values are merged to a total value (d1+d2=d) and the result is presented on the display. In case of a total value between 50 and 100 counts, the analyzer automatically re-measures Heliprobe BreathCard to confirm the result.

<table>
<thead>
<tr>
<th>Cut-off values</th>
<th>Heliprobe 0</th>
<th>Not Infected</th>
<th>Heliprobe 1</th>
<th>Borderline</th>
<th>Heliprobe 2</th>
<th>Infected</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>d \leq 25 counts</td>
<td></td>
<td>25 counts &lt; d &lt; 50 counts</td>
<td>d \geq 50 counts</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

NOTE

Heliprobe System \(^{14}\)C Urea Breath Test is a qualitative test. The result is presented as infected, borderline or not infected based on clinically established cut-off values. The measured count value shall not be used to assess the degree of infection or bacterial load.
9. Installation and set-up

Unpack and place Heliprobe Analyzer on a stable and horizontal surface. Ensure there is no disturbance from sources of strong electromagnetic radiation or radioactivity since this may affect its performance. Default settings are pre-installed and no calibration is required. In general, no adjustments are necessary.

Set-up the analyzer according to section 9.1 or 9.2. Date and time can be adjusted according to section 9.3 if necessary.

After set-up is complete, check and note the background value. This may be useful for monitoring variation in background radiation.

**NOTE**
If Heliprobe Analyzer must be disconnected or if the power fails, set-up must be performed according to the procedure described in section 9.1 or 9.2 to regain the correct background value.

9.1. Quick start

1. Connect the supplied power adapter to Heliprobe Analyzer (via the lower rear panel) and to the electrical outlet.

2. Insert the Protection Card.

3. Wait for at least 34 minutes to obtain the correct background value.

4. The analyzer is ready for test measurement when the diode light is green.

9.2. Alternative set-up

1. Connect the supplied power adapter to the electrical outlet but do NOT connect it to the analyzer yet (disconnect if already connected).

2. Press and hold the **Start/Stop** key and connect the power supply to the lower rear panel of the analyzer. The analyzer is now in a mode where settings can be adjusted.

3. **Set-up menu** appears in the display. Press the **Confirm** key.

4. **Choose menu, clear start?** appears in the display.
5. Press the Confirm key OK or the Menu key ■ to proceed through the settings workflow. See the flow chart for further details.

NOTE
If clear start is performed, or if no current background value is present in the software memory, a background measurement starts automatically. The red diode lights up to indicate that the background measurement has started and continues to light during the measurement. When the green diode lights up, the analyzer is ready to use.

6. When Set-up completed, exit? appears in the display, insert the Protection Card and press the Confirm key OK.

7. Wait for at least 17 minutes (1000 seconds) for background measurement. The diode light is red during this measurement.

8. The analyzer is ready for use when the background measurement is complete and the diode light changes to green.

9.3. Adjustment of date and time
Date and time can be adjusted as follows:

1. Proceed through steps 1–4 above (9.2).

2. When Choose menu, clear start? appears in the display, press the Menu key ■ until Choose menu: Set clock? appears.

3. Press Confirm key OK.

4. Set the current date and time by pressing the Print key ▲ (to lower) or the Menu key ■ (to raise) the digits in the display. Use the Confirm key OK to proceed to the next digit.

5. Proceed through the menu by pressing the Menu key ■ until Set-up completed, exit? appears.

6. Press Confirm key OK.

7. Insert the Protection Card and wait at least 35 minutes (2000 seconds) for background measurement.
10. Default settings

<table>
<thead>
<tr>
<th>Operation</th>
<th>Default setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initial background measurement at set-up</td>
<td>20 cycles of 50 seconds (1000 seconds)</td>
</tr>
<tr>
<td>Continuous background measurement</td>
<td>40 cycles of 50 seconds (2000 seconds)</td>
</tr>
<tr>
<td>Background value</td>
<td>Mean value of 40 cycles of 50 seconds</td>
</tr>
<tr>
<td>Background cut-off</td>
<td>250 counts per 250 seconds</td>
</tr>
<tr>
<td>Heliprobe BreathCard measurement</td>
<td>250 seconds</td>
</tr>
<tr>
<td>Automatic re-measurement of values between 25-100 counts</td>
<td>Up to 3 additional cycles of 250 seconds</td>
</tr>
</tbody>
</table>

**NOTE**
Default settings are validated for optimal function and correct results. Kibion recommends NOT changing any default settings. In case the environmental background is higher than the cut-off value (250 counts), the cut-off value can be increased in the set-up menu. Always contact your local sales representative for guidance before changing any settings.

10.1. Changing default settings

To change settings, proceed as follows:

1. Follow steps 1–4 in section 9.2.
2. Proceed through the menu using the *Menu* key and use the *Confirm* key to select/confirm the mode to be changed.
3. Use the *Print* key or *Menu* key to adjust the settings/digits.
4. Proceed through the menu until *Set-up completed, exit?* appears on the display.
5. Press *Confirm* key.
6. Insert the Protection Card and wait for at least 35 minutes (2000 seconds) for background measurement.
7. The analyzer is ready for use when the background measurement is completed and the diode light turns green.

If **clear start** is performed, or if no current background value is present in the software memory, a background measurement
starts automatically. The red diode lights up to indicate that the background measurement has started and continues to light during the measurement.

11. Measurement and analysis

1. Swallow

2. Wait

3. Open pack

4. Exhale

5. Insert

6. Start
11.1. How to perform a Heliprobe UBT test

1. Swallow a HeliCap capsule with a glass of water and wait for 10 minutes.

2. Open the package and remove the Heliprobe BreathCard. Exhale into the Heliprobe BreathCard until the indicator changes color from orange to yellow (1–4 minutes).
   Ensure that the two air outlets are free and allow exhaled air to pass through.

   NOTE
   Do not inhale through the BreathCard. Remove Heliprobe BreathCard from the mouth if a fresh breath of air is needed. Do not drink in between.

3. Gently squeeze out any excess air without touching the plastic filter shield (mylar).

4. Remove the Protection Card and insert Heliprobe BreathCard into the slot with the mouthpiece facing outwards and the indicator side facing upwards. The display shows: “ready to measure, standard program”.

5. Press the Start/Stop key to start the measurement and analysis.
   The display shows “measuring” and indicates the time remaining (seconds).

6. When measurement and analysis are completed, two beeps sound and the result is automatically shown (for 20 seconds) on the display as: Heliprobe 0, Heliprobe 1 or Heliprobe 2.
   To recall the result, press the Confirm key without removing the BreathCard.

<table>
<thead>
<tr>
<th>Grading</th>
<th>Disease status</th>
<th>Cut-off values (counts)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Heliprobe 0</td>
<td>NOT infected</td>
<td>d ≤ 25</td>
</tr>
<tr>
<td>Heliprobe 1</td>
<td>Borderline</td>
<td>25 &lt; d &lt; 50</td>
</tr>
<tr>
<td>Heliprobe 2</td>
<td>Infected</td>
<td>d ≥ 50</td>
</tr>
</tbody>
</table>
Note or print* the results and remove the BreathCard. Measurement and analysis are now finalized.

Insert the Protection Card and keep the analyzer turned ON.

**NOTE**
When the measured value is between 25 and 100 counts, the instrument will automatically re-measure Heliprobe BreathCard (up to three additional measurement cycles) to secure the results. Measurement can therefore take longer. The obtained result is the mean value of the additional measurements. Thus, borderline results are always confirmed by re-measurement.

### 11.2. View measurement values

To view the measured count values, press the Confirm key **OK**

\[
d1 = \text{Activity from upper reactivity filter} \\
d2 = \text{Activity from lower reactivity filter} \\
d = (d1+d2) \text{ total activity} \\
t = \text{measuring time}
\]

* To obtain print-outs, a suitable printer must be connected. Contact your local distributor for guidance.
To view the background value, press the Confirm key \textbf{OK}.

\textbf{Long BGR 1} = Most recent average background value for Geiger-Müller counter 1

\textbf{Long BGR 2} = Most recent average background value for Geiger-Müller counter 2

\hline
\end{tabular}

\section*{13. Service and maintenance}

Heliprobe Analyzer does not need regular service. However, we recommend checking the background value at least once a year or if contamination is suspected.

Always check the background value if the analyzer has been moved or re-installed.

If necessary, clean the outer part of Heliprobe Analyzer using a damp cloth and mild detergent. Do not rinse or immerse the analyzer in water or any other liquid.

If the instrument malfunctions or needs repair, please contact your local distributor.

All service and repair must be performed by Kibion.
14. Disposal

Heliprobe Analyzer should be disposed as electronic and electrical waste.

Replace Heliprobe BreathCard in the single package prior to disposal according to local regulations or guidelines.

**NOTE**

Sampled Heliprobe BreathCard from an infected patient typically gives about 200–2000 counts. The expected radioactivity in Heliprobe BreathCard sampled from an infected patient is approximately 0.2–1.6 kBq $^{14}$C (0.005–0.05 μCi).
